

Please amend WO 2005/075770 in the specification page 1, after line 19 and before line 20 to read as follows:

Special handles must be used for glass doors, where the latches housed into a box with reduced size and refined design, since the box remains completely visible.

German Patent DE4009764 describes a door handle provided with a kick latch, having the same characteristics as recited in the preamble of the first claim. This type of known handle cannot be easily assembled and mounted to a door.

The purpose of the present invention is to realise a door handle with built-in spring latch in order to eliminate the bulky box that contains the mechanism and the bolt with key.

Please amend WO 2005/075770 in the specification page 10, line 19 to read as follows:

According to this embodiment, the housing and guiding box (40) has a housing (40a) for the spring latch (50) provided with a rear hooked appendix (50a), which engages with the head (51a) of a vertical lever (51), whose base is pivoted by means of a horizontal ~~pin (52)~~ pin (51b) inside a fork (40) on the rear side of the plate (42) that supports the box (40).
